

Project Description:

The proposed roadway improvements for this project consists of the installation of a two-way left turn lane to facilitate safer and more efficient turning movements. The scope further includes the addition of dedicated right turn lanes, new right and left turn signal phases, and upgrades to ADA ramps in accordance with current standards (including pedestrian push buttons and junction box replacement). Additional enhancements involve traffic signal and pedestrian crossing upgrades, improved signing and pavement markings, drainage improvements, commercial driveway access control, and other safety-related measures.

Project Purpose:

The purpose of the project is to provide safer and more efficient travel conditions throughout the corridor by improving the pavement, updating to a continuous two-way center turn lane throughout, adding dedicated right turn lanes, and upgrading traffic signals and pedestrian crossings.

Project Need:

A safety study completed in 2014 identified the following project needs: uncontrolled access, poor intersection and driveway sight distance, poor pavement condition, fixed objects within clear zone, multiple rear end, angle, and head on crashes.
