

WELCOME

U.S. 202 (Buckingham Rd) and York Rd Roundabout
Intersection Improvement Project
Public Meeting

MAY 21, 2024

INTRODUCTIONS

- Nathan Parrish, P.E., Consultant Project Manager

- Michael P. Mastaglio, P.E., PTOE, Project Manager

- Andrew Gould, P.E., Project Engineer

QUESTIONS?

Questions can be submitted by clicking on the Q&A feature located at the top of your screen

PROJECT OVERVIEW

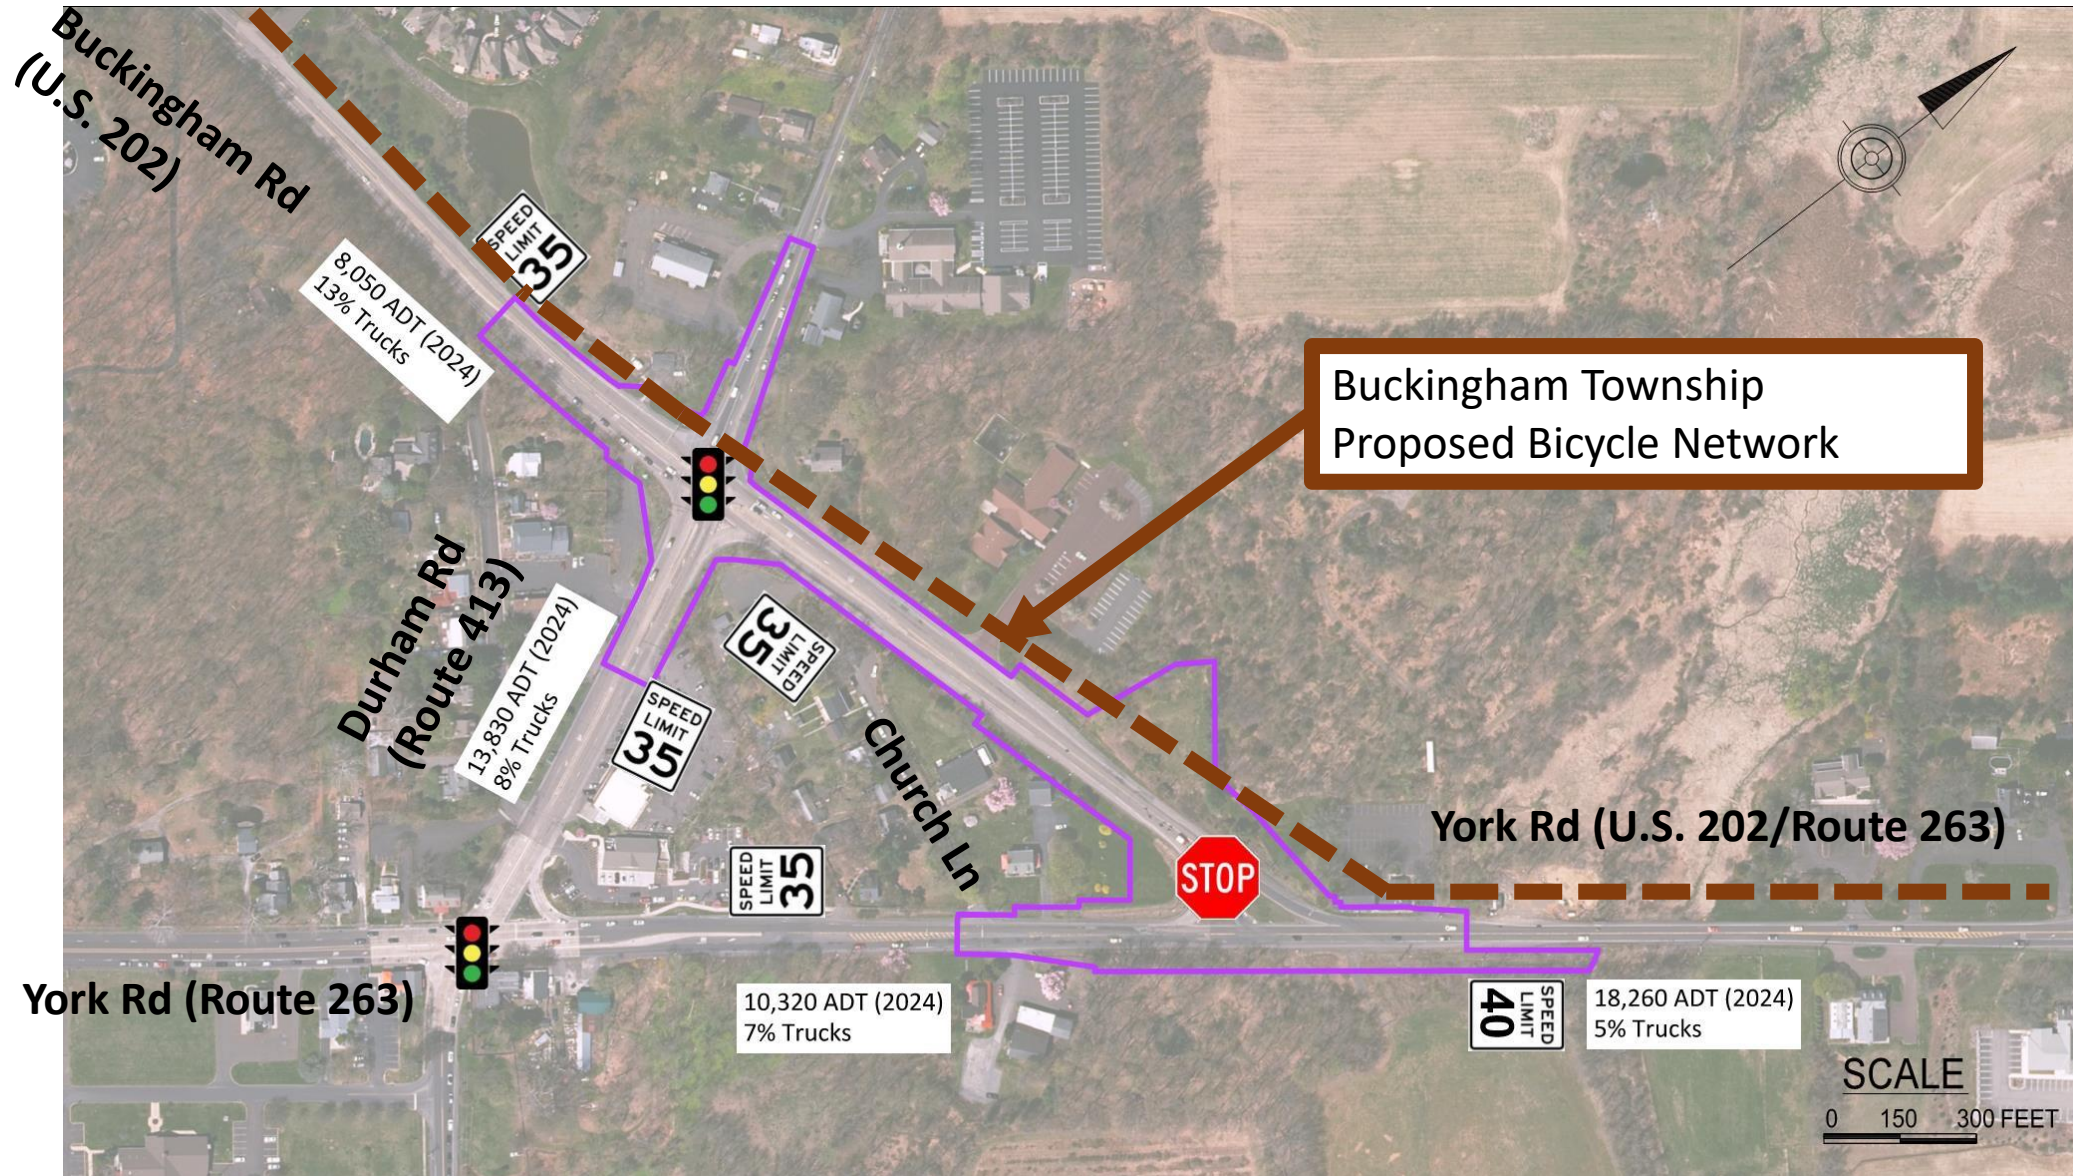

PROJECT OVERVIEW

PROJECT OVERVIEW

PROJECT OVERVIEW

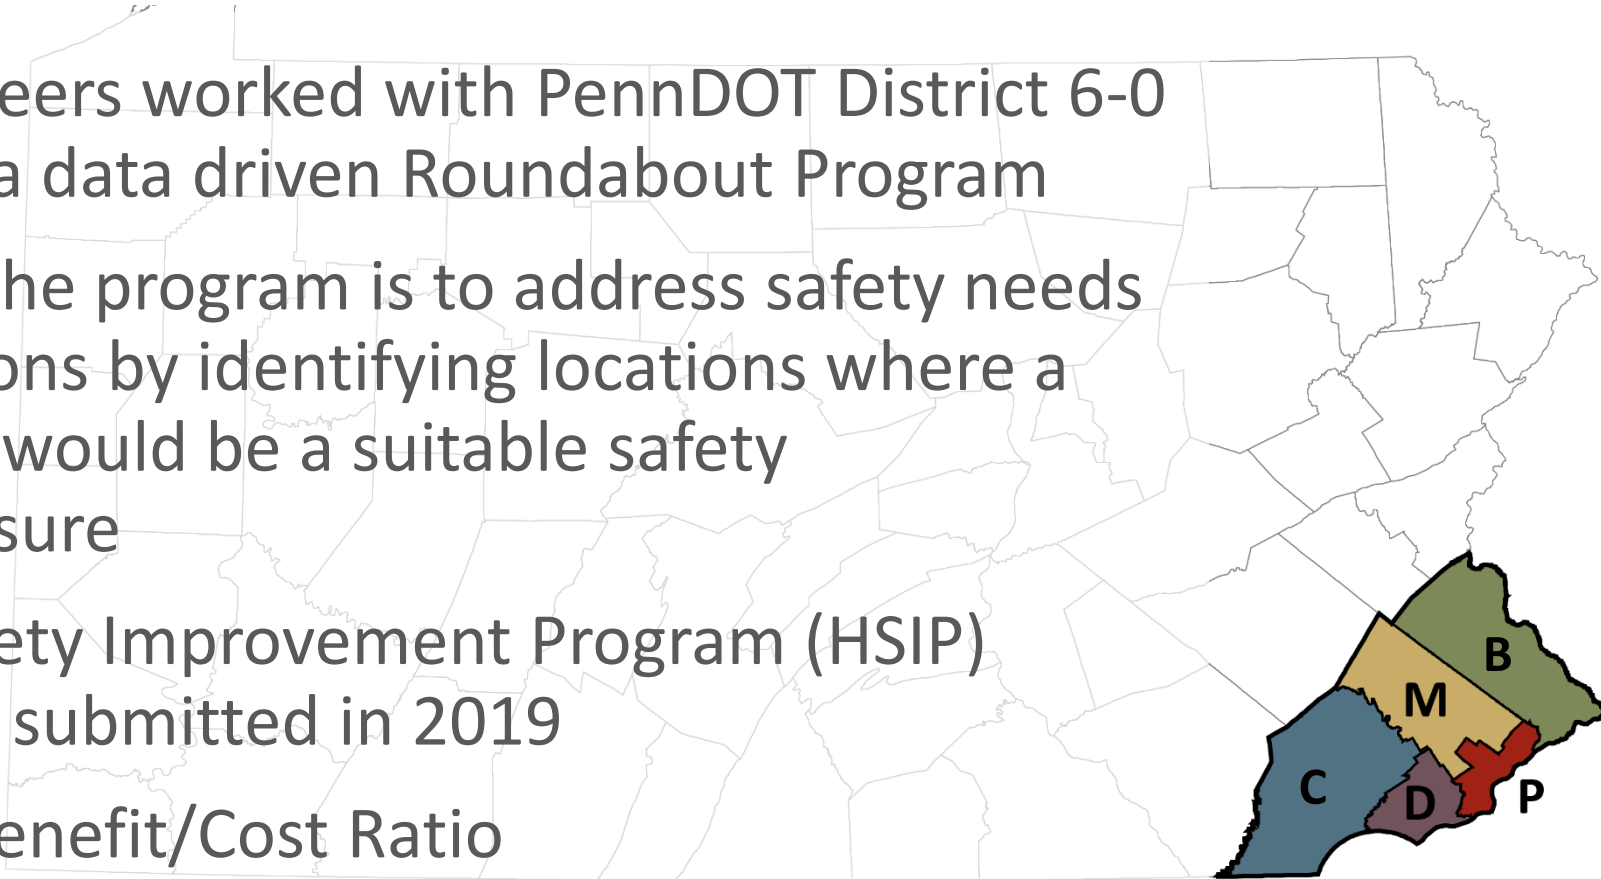

PROJECT SELECTION

District-Wide Roundabout Program

- Urban Engineers worked with PennDOT District 6-0 to establish a data driven Roundabout Program
- The goal of the program is to address safety needs at intersections by identifying locations where a roundabout would be a suitable safety countermeasure
- Highway Safety Improvement Program (HSIP) Applications submitted in 2019
- Prioritized Benefit/Cost Ratio

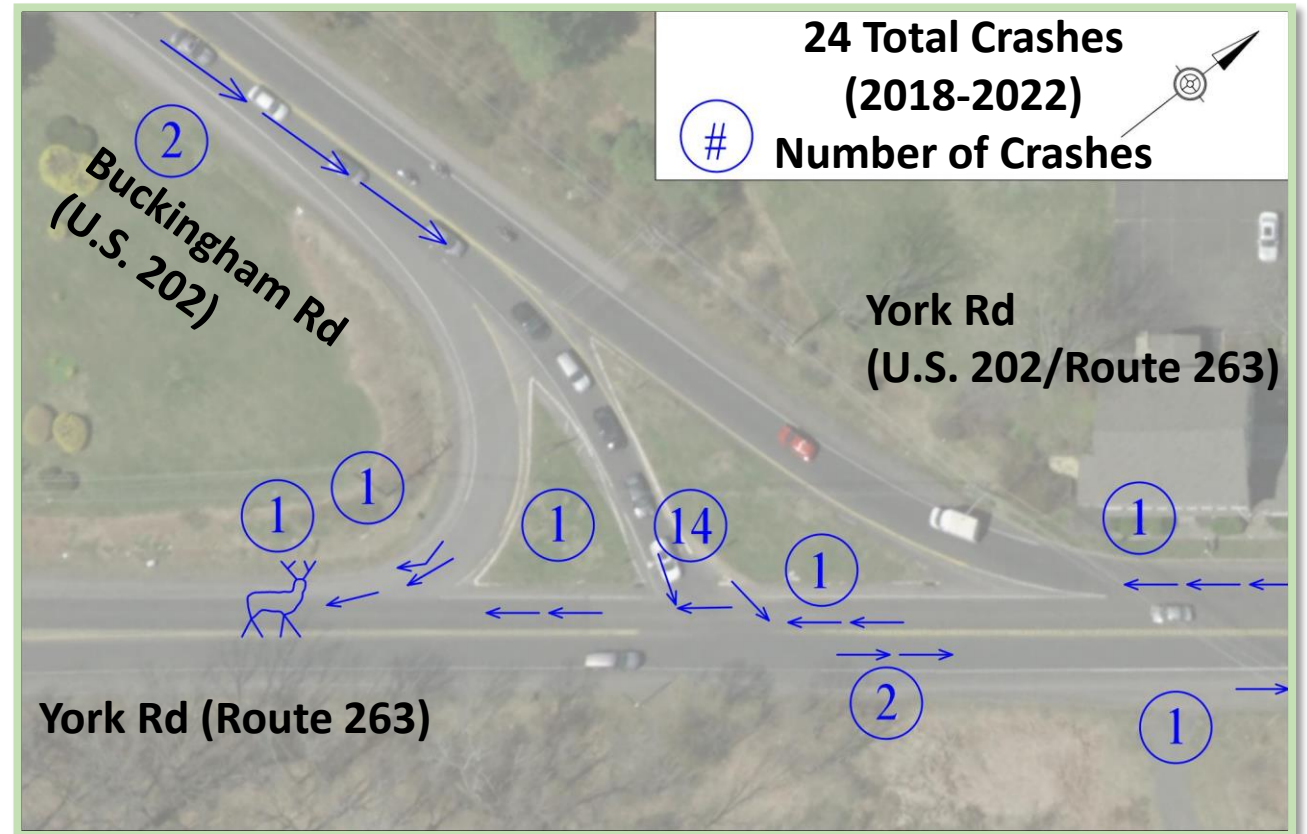

DISTRICT 6-0

PURPOSE

U.S. 202 & Route 263 Buckingham Rd & York Rd

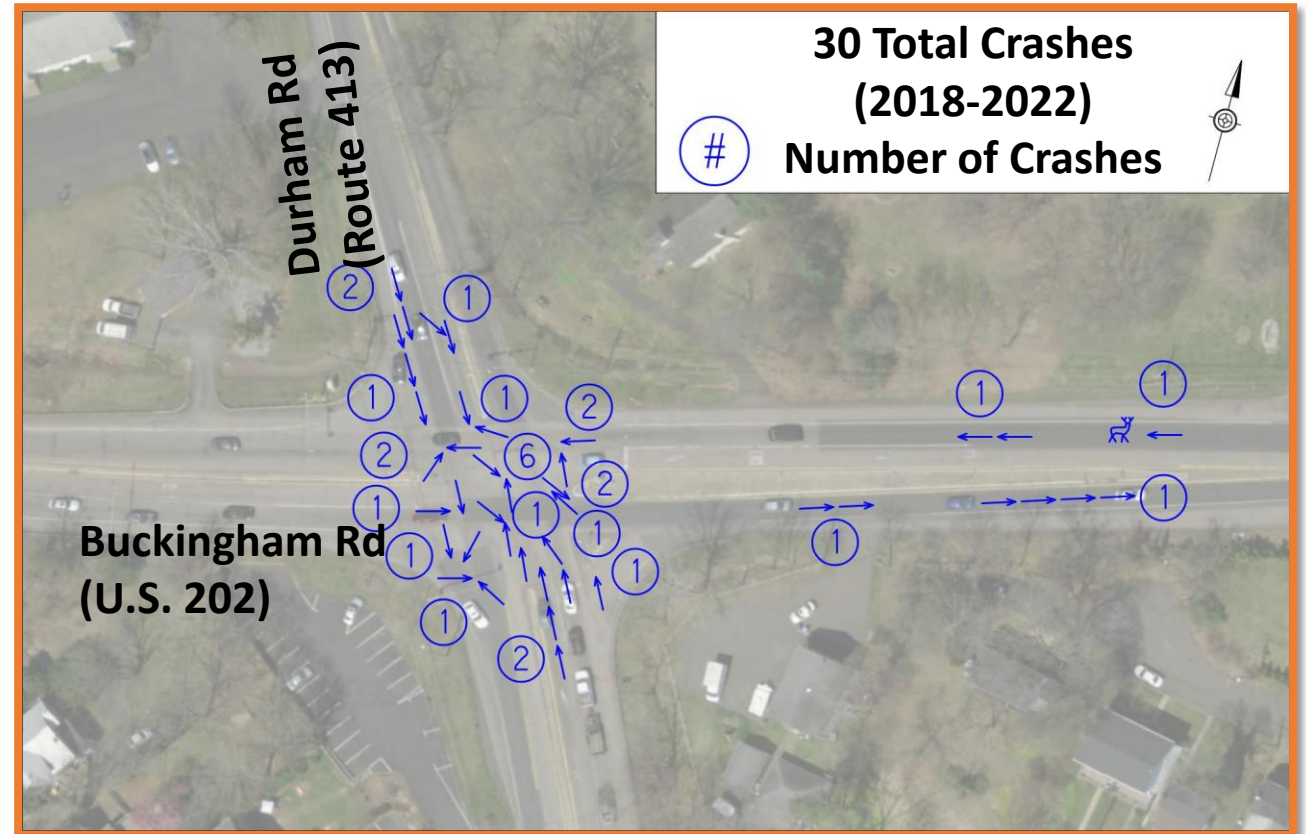

- SR 0202/0263 intersection has a history of severe crashes.
 - 25% of reported crashes had suspected serious, minor or possible injury.
- The intersection has a history of angle crashes.
 - 58% of reported crashes were angle crashes.
 - 96% of reported crashes had no weather or environmental factors.

PURPOSE

U.S. 202 & Route 413 Buckingham Rd & Durham Rd

- SR 0202/0413 intersection has a history of severe crashes.
 - 53% of reported crashes had suspected serious, minor or possible injury.
- The intersection has a history of angle crashes.
 - 63% of reported crashes were angle crashes.
 - 90% of reported crashes had no weather or environmental factors.

PURPOSE

- Reduce the amount and severity of crashes at the intersections.
- Relieve congestion
- Improve accessibility

Source: PennDOT website

INTERSECTION CONTROL EVALUATION (ICE)

- Federal HSIP funding requires benefit/cost analysis to secure construction funding.
- Roundabout shows a **higher reduction** in crashes
- Roundabouts are generally safer and more efficient than traffic signals
- Traffic signal would require realignment and create more impacts to the local properties/businesses

Summary of Predicted Crash Performance - Alternative Analysis

Safety Performance Summary

Project Totals	Total Crashes			
	Existing	Roundabout	Traffic Signal	
Predicted Average Annual Crash Frequency	2.31	1.29	1.87	--
Expected Average Annual Crash Frequency	--	--	--	--
Change from Existing Conditions	--	-1.02	-0.44	--

WHY A ROUNDABOUT?

- Address PennDOT's Strategic Highway Safety Plan (SHSP).
- Roundabouts are an FHWA Proven Safety Countermeasure.

Safety Statistics

In September 2023, PennDOT released data for 42 roundabouts on state routes at intersections that were previously stop- or signal-controlled. These roundabouts were reviewed based on having at least three years of data available before and after the roundabout's installation. These 42 comprise all the roundabouts on state routes that met the review parameters. Department data based on police-submitted crash reports spanning the years 2003 through 2022 shows:

- Crashes involving suspected serious injuries were reduced by 24 percent;
- Crashes involving suspected non-serious injuries were reduced by 51 percent; and
- The total number of crashes dropped three percent.

In addition to the 42 roundabouts meeting the review criteria, 36 other roundabouts have been installed on state routes.

WHY A ROUNDABOUT?

Roundabout Operation Characteristics

Roundabouts		Traffic Circles
Yield-at-Entry Rule: <ul style="list-style-type: none">• Entering traffic yields to circulating traffic, which always keeps moving.• Very efficient with heavy traffic.• No weaving distance is needed, so roundabouts are small and fit in compact spaces.	YIELD 	Entering traffic may interfere with circulating traffic: <ul style="list-style-type: none">• Circulating traffic can not clear when entering traffic fills circle.• Heavy traffic causes gridlock.• Circles must be large to provide long weaving distances.
Entering traffic is deflected slowly around the central island: <ul style="list-style-type: none">• Deflection controls speed without enforcement, thereby reducing accidents.• Deflection forms gaps in traffic so other vehicles can enter.• Entry flare adds lanes	DEFLECTION 	Inconsistent entry design may allow traffic to enter at high speed: <ul style="list-style-type: none">• Serious accidents can result on high speed streets.• Fast entries impede gap acceptance and defeat the yielding process.
Flare increases capacity at the intersection, where capacity is needed most: <ul style="list-style-type: none">• Flare promotes narrow streets between roundabouts, saving cost and neighborhood impacts.	FLARE 	Poor entry conditions may not benefit from flare: <ul style="list-style-type: none">• Poor intersection capacity even with large traffic circles.• Higher capacity requires wide streets between circles, wasting money and land

ROUNDABOUT BENEFITS

Benefits of Roundabouts

- Improve safety
- Slower vehicle speeds
- Efficient traffic flow
- Reduces pollution and fuel use
- Traffic calming
- Gateway opportunity

Roundabout (3-leg)

6 Conflict Points

ROUNDAABOUTS & PEDESTRIANS

Pedestrian Crossings at Roundabouts

- Crosswalks set back one car length
- Separates conflicts between cars and pedestrians
- Allows pedestrians to cross when cars are queued
